Experiment 5

Ex. No.: 5

View Last Activity of Your PC

Aim

To review recent actions and system events on an authorised Windows computer using LastActivityView.

Tools required

1. Windows lab workstation or an authorised offline Windows installation.
2. LastActivityView.
3. A case-notes location for recording the selected timeline entries.

Idea/Theory

1. LastActivityView collects activity records from several Windows sources and presents them as one timeline.
2. Entries can include logon, logoff, startup, shutdown, program execution, file or folder access, and other user or system actions.
3. A displayed entry is an interpretation of an underlying artefact; significant events should be checked against the source data.
4. Times must be interpreted with the system time zone, clock condition, and collection context.

Experiment 5 — continued

Procedure/Steps

1. Open LastActivityView on the authorised lab system.
2. Allow the utility to read its supported Windows activity sources and populate the list.
3. Sort by **Action Time** to review the newest activity first.
4. Inspect the description, file name, and full path associated with relevant entries.
5. Filter the timeline to the case period and identify events that need validation.
6. Save the authorised report or capture the selected rows during the lab run, then document the source and time-zone context.

Observation/Output

Screenshots to be attached from the lab run (tool: LastActivityView)

Result

To be completed after the lab run.
